

- Download Xampp server.
- Start Apache and MySQL from the xampp control panel

- Go to local host

- Select PhpMyAdmin from the navbar
- In the create database section enter database name as “mgf” and click create
- After the database is created navigate to the database and then select import from the navbar
- In file to import click on choose a file and then select the sql file provided in the test “exercise.sql”
- After successfully importing check if we have two tables named “companies” and “contacts” in the database named “mgf”.
- Select the Submission that was submitted in the submission there will be a folder named “MGF” copy that folder, navigate to where Xampp is installed on the system and then in the Xampp folder there would be a folder called “htdocs” paste the “MGF” folder there.  
**\Xampp\htdocs**
- After that Select the Submission that was submitted in the submission there will be a folder named “project” open the folder it will have another folder named “MGF\_Crud” open the folder then the project files would be there.

- Run the project by opening the terminal in that folder and running the command “npm run start” or “ng serve”
- Then go to <http://localhost:4200/> to see the project
